RFP Overview

Procurement of an integrated IT operation network troubleshooting tool, including maintenance and support
Background

- SARS has made investments in various infrastructure monitoring and management systems and it is possible to identify whenever a device is no longer available. These however do not provide a real-time map based view that enables the organisation to determine the health of its ICT infrastructure at any point in time, nor does it assist to identify the root cause of degraded network performance due to underlying errors effectively.

- The SARS network connects more than 170 offices countrywide, and consists of more than 3000 network routers and switches and other devices, while additional equipment is used to secure infrastructure in the network.
Objectives of this RFP

SARS’s requirements include the ability to

• Establish the current topology at each SARS site
• Identify and highlight changes in the physical and configuration architecture to ensure improved problem identification
• Identify the impact of changes,
• Because of the time lapse between planned installations on the network and updates on the CMDB, there is an urgent requirement for “real time” information
• The information that is collected should be reported on
• Be alerted on any status change of a network device on the network.
